

IN THE CLAIMS:

- 1 1. (Previously Amended) A direct methanol fuel cell system comprising:
2 a direct methanol fuel cell including:
3 an anode;
4 a cathode;
5 a membrane electrode assembly including a protonically-conductive
6 membrane having first and second surfaces on which catalysts are dis-
7 posed, anode and cathode diffusion layers disposed, respectively, on said
8 catalysts;
9 a source of neat or concentrated methanol;
10 a conduit coupled to said methanol source and to one or more valves for deliver-
11 ing neat or concentrated methanol to said anode; and
12 a controller coupled to said one or more valves and, responsive to an increase in
13 demand for output power from said fuel cell, operating to actuate one or more of said
14 valves to allow neat or concentrated methanol to be delivered to said anode.
- 1 2. (Cancelled) A direct methanol fuel cell system comprising:
2 a direct methanol fuel cell including
3 an anode including an anode flow field plate;
4 a cathode including a cathode flow field plate;
5 a membrane electrode assembly including a protonically conductive mem-
6 brane having first and second surfaces on which catalysts are disposed,
7 anode and cathode diffusion layers disposed, respectively, on said cata-
8 lysts;
9 a source of neat or concentrated methanol;
10 a pump coupled to said methanol source and said anode for pumping fuel to said
11 anode flow field plate;

12 a conduit coupled to said methanol source and to one or more valves for deliver-
13 ing neat or concentrated methanol to said anode diffusion layer, said conduit extending
14 through said anode flow field plate into said anode diffusion layer; and
15 a controller coupled to said one or more valves and, responsive to an increase in
16 demand for output power from said fuel cell, operating to actuate one or more of said
17 valves to allow neat or concentrated methanol to reach said anode diffusion layer.

1 3. (Original) A diffusion layer for use in a direct oxidation fuel cell comprising:
2 a layer of material having a first surface which is oriented to receive fuel and a second
3 surface from which diffused fuel passes, said layer including one or more apertures ex-
4 tending from said first surface to said second surface, said one or more apertures for al-
5 lowing neat or concentrated fuel to effectively bypass said diffusion layer.

1 4. (Currently amended) The diffusion layer as in claim 3 wherein said one or more
2 apertures are connected by one or more conduits and one or more valves to a source of
3 fuel.

1 5. (Original) The diffusion layer as in claim 3 wherein said one or more aper-
2 tures are lined with a material which is substantially impermeable to said fuel, thereby
3 inhibiting said fuel from migrating laterally into said diffusion layer.

1 6. (Original) A membrane electrode assembly for use with a direct oxidation
2 fuel cell, said assembly comprising:
3 a protonically conductive membrane having first and second surfaces on which
4 catalysts are disposed;
5 anode and cathode diffusion layers disposed, respectively, on said catalysts, said
6 anode diffusion layer having a first surface which is oriented to receive fuel and a second
7 surface in contact with said catalyst, and one or more apertures extending through the
8 thickness of said anode diffusion layer, said one or more apertures for allowing neat or
9 concentrated fuel to effectively bypass said diffusion layer.

1 7. (Original) The membrane electrode assembly as in claim 6 wherein said one
2 or more apertures are connected by one or more conduits and one more valves to a source
3 of fuel.

1 8. (Original) The membrane electrode assembly as in claim 6 wherein said one
2 or more apertures are lined with a material which is substantially impermeable to said
3 fuel, thereby inhibiting said fuel from migrating laterally into said diffusion layer.

1 9. (Cancelled) A direct methanol fuel cell comprising:
2 an anode;
3 a cathode;
4 a membrane electrode assembly including a protonically conductive membrane
5 having first and second surfaces on which catalysts are disposed, anode and cathode dif-
6 fusion layers disposed, respectively, on said catalysts, said anode diffusion layer having a
7 first surface which is oriented to receive fuel and a second surface in contact with said
8 catalyst, and one or more apertures extending through the thickness of said anode diffu-
9 sion layer, said one or more apertures for allowing neat or concentrated fuel to effectively
10 bypass said diffusion layer.

1 10. (Cancelled) The direct methanol fuel cell as in claim 9 wherein said one or
2 more apertures are connected by one or more conduits and one more valves to a source of
3 fuel.

1 11. (Cancelled) The direct methanol fuel cell as in claim 9 wherein said one or
2 more apertures are lined with a material which is substantially impermeable to said fuel,
3 thereby inhibiting said fuel from migrating laterally into said diffusion layer.

1 12. (Cancelled) A direct methanol fuel cell system comprising:
2 a direct methanol fuel cell including

3 an anode;
4 a cathode;
5 a membrane electrode assembly including a protonically conductive mem-
6 brane having first and second surfaces on which catalysts are disposed,
7 anode and cathode diffusion layers disposed, respectively, on said cata-
8 lysts, said anode diffusion layer having a first surface which is oriented to
9 receive fuel and a second surface in contact with said catalyst, and one or
10 more apertures extending through the thickness of said anode diffusion
11 layer, said one or more apertures for allowing neat or concentrated fuel to
12 effectively bypass said diffusion layer;
13 a source of neat or concentrated methanol;
14 a pump coupled to said methanol source and said anode for pumping fuel to said
15 anode;
16 a conduit coupled to said methanol source and to one or more valves for deliver-
17 ing neat or concentrated methanol to said apertures in said anode diffusion layer; and
18 a controller coupled to said one or more valves and, responsive to an increase in
19 demand for output power from said fuel cell, operating to one or more of said valves to
20 allow neat or concentrated methanol to flow through said apertures.

1 13. (Cancelled) The system as in claim 12 wherein said one or more apertures are
2 lined with a material which is substantially impermeable to said fuel, thereby inhibiting
3 said fuel from migrating laterally into said diffusion layer.

1 14. (Cancelled) A method of rapidly increasing output power from a direct oxida-
2 tion fuel cell, said method comprising the steps of:
3 providing a source of neat or concentrated fuel;
4 providing a conduit and one or more associated valves between said fuel source
5 and an anode diffusion layer in a direct oxidation fuel cell, said layer having more aper-
6 tures extending through the thickness of said layer;
7 sensing a demand for output power from said fuel cell;

8 in response to an increase in demand for power, opening or more of said valves whereby
9 neat or concentrated fuel passes through said apertures and is applied to a protonically
10 conductive membrane.

1 15. (Previously Added) The direct methanol fuel cell system as defined in claim 1
2 wherein at least one of said conduits extends to a first surface of said anode diffusion
3 layer that is oriented to receive fuel.

1 16. (Previously Added) The direct methanol fuel cell system as defined in claim 1
2 wherein at least one of said conduits extends into said anode diffusion layer.

1 17. (Previously Added) The direct methanol fuel cell system as defined in claim 1
2 wherein at least one of said conduits extends through said anode diffusion layer.

1 18. (Previously Added) The direct methanol fuel cell system as defined in claim 1
2 wherein at least one of said conduits extends directly to said protonically-conductive
3 membrane.

1 19. (Previously Added) The direct methanol fuel cell system as defined in claim 1
2 further comprising a pump coupled to said methanol source and said anode for pumping
3 fuel to an associated anode flow field plate.

Please add the following new claims:

1 20. (New) The direct methanol fuel cell system as defined in claim 1 wherein at least
2 one of said conduits extends directly to said catalyzed surface of the protonically-
3 conducted membrane.

1 21. (New) A method of operating a direct oxidation fuel cell, having a protonically
2 conductive membrane with an anode catalyst on one aspect thereof, and an anode diffu-
3 sion layer disposed in contact with the anode catalyst, the method including the steps of:
4 delivering a first fuel substance substantially comprised of at least two chemicals
5 to the anode of the direct oxidation fuel cell during normal operating conditions; and
6 controllably delivering a second fuel substance under increased power demand
7 conditions.

1 22. (New) The method of operating a direct oxidation fuel cell as defined in claim 21
2 wherein one of said chemicals comprising said first fuel substance is a carbonaceous fuel
3 substance.

1 23. (New) The method of operating a direct oxidation fuel cell as defined in claim 22
2 wherein said carbonaceous fuel substance includes methanol.

1 24. (New) The method of operating a direct oxidation fuel cell as defined in claim 21
2 wherein one of said chemicals comprising said first fuel substance is water.

1 25. (New) The method of operating a direct oxidation fuel cell as defined in claim 21
2 wherein said second fuel substance includes a carbonaceous fuel substance.

1 26. (New) The method of operating a direct oxidation fuel cell as defined in claim 21
2 wherein said second fuel substance is neat methanol.

1 27. (New) The method of operating a direct oxidation fuel cell as defined in claim 21
2 wherein said first fuel substance is an aqueous solution of methanol and said second fuel
3 substance is an aqueous methanol solution that comprises a higher ratio of methanol
4 compared to water than said first fuel substance.

1 28. (New) The method as defined in claim 21 including the further step of delivering
2 said second fuel substance responsive to an associated controller when said controller
3 senses an increase in power demand.

1 29. (New) The method as defined in claim 21 including the further step of delivering
2 said second fuel substance to the surface of the anode diffusion layer.

1 30. (New) The method as defined in claim 21 including the further step of delivering
2 said second fuel substance into the anode diffusion layer.

1 31. (New) The method as defined in claim 21 including the further step of delivering
2 said second fuel substance directly to the anode catalyst that is disposed on or in contact
3 with the protonically conductive membrane.

1 32. (New) A direct oxidation fuel cell system, comprising:
2 a direct oxidation fuel cell including:
3 an anode;
4 a cathode;
5 a membrane electrode assembly including a protonically-conductive
6 membrane having first and second surfaces on which catalysts are dis-
7 posed, anode and cathode diffusion layers disposed, respectively, on said
8 catalysts;
9 a source of highly concentrated fuel substantially comprised of one or more car-
10 bonaceous fuel substances;
11 a conduit coupled to said fuel source and to one or more valves for delivering said
12 highly concentrated fuel to said anode; and
13 a controller coupled to said one or more valves and, responsive to an increase in
14 demand for output power from said fuel cell, operating to actuate one or more of said
15 valves to allow highly concentrated fuel to be delivered to said anode.
